HOW THE POLL WAS DONE

This Hartford Courant/Institute for Social Inquiry Connecticut Poll (#114) was conducted by the Institute for Social Inquiry at the University of Connecticut. The ISI, whose Director is Everett Carll Ladd, was founded in 1968 and since then has engaged in a wide variety of projects using the tools of social science better to understand Connecticut and the nation. Since 1977, the Institute has provided the administrative setting for the Roper Center for Public Opinion Research, the largest collection of survey (poll) data in the world.

The ISI has been conducting the Connecticut Poll since March 1979. CONNPOLL is designed as the ongoing "poll of record" for our state. Since 1985, the Hartford Courant and the Institute for Social Inquiry have jointly sponsored the Connecticut Poll, and these results may have appeared first in the pages of that newspaper.

This survey was conducted under the direction of G. Donald Ferree, Jr., Director of the Connecticut Poll, and Nancy Barth, Assistant Director for Survey Research. The interviews were supervised by Lilly Markons, Manager of Interview Operations. For further information, contact Mr. Ferree or Ms. Barth at (203) 486-4440.

A total of 500 randomly selected adult residents of Connecticut were interviewed over the telephone from our offices in Storrs from July 23 to July 29, 1991. Telephone numbers originally dialed were generated by a computer in proportion to the number of adults living in each area, and the actual respondent was selected at random from within the household. Multiple calls were made to each household to secure an interview, and if the eligible respondent was not available, an appointment was made to call him or her back.

Theoretically, results from this survey have a "margin of error" of about +/- 5%. This means that, had we asked every adult in Connecticut exactly these questions at the time the survey was conducted, there is only a one in twenty chance that the answers would differ by more than that in either direction from what we report here. Of course, there could be differences because of changes in question wording, events occurring in the meantime, or any of the practical difficulties involved in taking a scientific survey. Results based on subgroups are subject to a larger "margin of error".
