Title: Indiana Poll # 18

Survey Organizations: Center for Survey Research, Indiana University

Field Dates: January 18 - 23, 1993

Sample: Adult residents of Indiana

Sample Size: 448

Interview Modes: Telephone Interview

Weight Location: None

Please note that data provided by the Roper Center for Public Opinion Research may not be re-disseminated without written permission. The results of any analyses conducted on the data may, however, be published with appropriate acknowledgments and source citation.

Center for Survey Research
INDIANA POLL

The Indiana Poll, established in 1982, is an omnibus telephone survey covering a wide range of topics related to current social, economic and political issues. The Center for Survey Research conducts a statewide Poll twice yearly. At a fixed price per item, the Center offers time on the Indiana Poll to academic researchers, state agencies and associations, and other policy makers throughout the state. The Indiana Poll gives individuals and organizations the opportunity to "piggyback" their own questions onto a statewide survey.

Since its inception, the Center for Survey Research has conducted two Indiana Polls each year. The Indiana Poll is a scientifically selected sample of 800 adult Indiana residents obtained through a random-digit dialing procedure. The sampling error associated with a sample obtained in this manner is plus or minus 4%. In other words, on cane be 95% confident that the survey results are within plus or minus 4% of results that would have been obtained from interviewing all households with telephones in the state.

UNIVERSE: Adults aged 18 and over living in households with telephones in the state of Indiana.
SAMPLING: Random digit dialing.
NOTE:

EXTENT OF COLLECTION: 1 data file, 1 spss export file, 1 machine readable codebook, 1 spss card file

DATA FORMAT:

File Structure: rectangular
Cases: 448
Variables: 20
Record Length: 80
Records per case: 1

REPORT ON DATA COLLECTION PROCEDURES
FOR THE EIGHTEENTH INDIANA POLL

The Indiana Poll is a statewide telephone survey of adult Indiana residents conducted twice yearly by the Indiana University Center for Survey Research in Bloomington. This was the eighteenth poll in the series. The main purpose of the Indiana Poll is to provide accurate measurement of Hoosier public opinion on a variety of issues of interest to the general public, policy makers, and social scientists. This Poll began on January 13, 1992 and ended on January 28, 1992. Interviewers at the Center for Survey Research talked to 448 randomly selected respondents. Telephone numbers were randomly generated by a computer. The sample of telephone numbers was developed through the Waksberg/Mitofsky random digit dialing method. A modified version of the Carter/Trodahl procedure was used to randomly select the respondent within the household to be interviewed. The sampling error for this survey is plus or minus 6 percentage points at the 95 percent confidence level.

A pre-test of the survey was conducted on January 9, 1992. Data were collected by telephone using the University of California Computer Assisted Survey Methods software (CASES). Interviews were conducted from:

1:00 PM through 9:30 PM, Sunday - Thursday;
1:00 PM through 5:00 PM, Friday;
11:00 AM through 7:00 PM, Saturday

The data collection staff included seven supervisors and thirty interviewers. All interviewers receive at least 20 hours of training in interviewing techniques before production interviewing. Interviewers received 1 hour of specific training on the instrument and special procedures. Most of the data collection staff conducted at least 4 previous telephone surveys. The average age of the interviewers was in the mid-twenties.

Interviewers were instructed to read questions and response categories at a two words per second pace. Interviewers were also instructed to use neutral probes and feedback phrases. Audio and visual monitoring was regularly conducted by the telephone survey supervisors using the Center for Survey Research facilities which do not allow the interviewers to know they are being monitored. At the beginning of the survey, interviewers were constantly monitored by a supervisor. Later, monitoring was done randomly. Each interviewer was monitored at least twice during each four hour shift.

All CSR interviewers are given training in refusal conversion techniques as part of the 20 hours of training. It is standard CSR procedure to attempt to convert "refusals" at least twice. When possible a conversion attempt is made at the first instance of refusal. A second attempt is usually made after a few days.

SOME CHARACTERISTICS OF THE SURVEY

The following categorizes every case in the sample according to its final disposition. The average length of the interview was seven minutes.

448	Sample persons interviewed
225	Refused to be interviewed (after two attempts)
47	Away during survey period, language problems, illness
115	Business, group quarters
334	Non-working numbers, problems on the line
47	Never answered (at least 6 attempted calls with at least two attempts in each of three time periods - daytime, evenings, weekends)
1216	

Readers are reminded that, since survey research normally questions only a small proportion of the population, one must allow a certain margin of error. When considering all of the responses to a study such as this, percentages with less than eleven points between them would not normally be regarded as statistically significant at the 95% confidence level.

Surveys of this kind are sometimes subject to different kinds of inaccuracies of which precise estimates cannot be calculated and which may, in some cases, be even larger than the effects associated with sampling procedures. For example, findings may be influenced by events which take place while the survey is in the field and, of course, events occurring since the time the interviews were conducted could have changed the opinions reported here. Undetected flaws in the way the sampling and interviewing procedure were carried out could have a significant effect on the findings. Changing the wording of questions and the sequence in which they are asked can produce different results. Sometimes questions are inadvertently biased or misleading. And people who responded to the survey may not necessarily replicate the views of those who refused to be interviewed or who could not be found at home during the time the survey was conducted. Moreover, while every precaution has been taken to make these findings completely accurate, other errors may have resulted from the various practical difficulties associated with taking any survey of public opinion.

John Kennedy is the director of the Center for Survey Research. Jennie Lengacher is the field director. Further information regarding this study is available by writing Center for Survey Research, 1022 East Third Street, Bloomington, Indiana 47405, or by calling (812) 855-2573. This report conforms to the standards of disclosure of the National Council on Public Polls and the American Association for Public Opinion Research.

Q1

First, I am going to ask some questions about lotteries.

As you may know, Indiana and many other states operate lotteries. Many people play them both in Indiana and in other states.

How about you? In a typical week during the past year, about how much, if any, did you spend on Indiana state lottery tickets?

VALUE	N	PERCENT	CUMULATIVE PERCENT
0	228	51.2	51.2
